WELCOME TO OUR PRESENTATION

Project : *Intelligent IT Service Desk Agent*

An Intelligent IT Service Desk **Agent** is an AI-powered system that helps employees solve IT problems through a chatbot and automated ticket management. It can understand user requests, search a knowledge base, classify tickets, route them to the right team, and automate common solutions.

The workflow :

IT service desk is used across organizations for primary reasons:

1.STOP WORK BLOCKERS (Maximized Productivity):

When an employee's laptop crashes, VPN fails, or email locks up, they cannot work. The service desk provides a quick, structured route to get systems fixed so employees can return to their actual jobs instead of wasting hours waiting for help

2. Single Point of Contact (SPOC):

Instead of guessing who to call in the IT department, users have one dedicated channel (portal, chat, email, or phone). You report the issue $\rightarrow$ The service desk routes it directly to the right technician, hardware team, or software specialist

3. Service Request FulfillmentIT isn't just for broken things (incidents): it handles everyday business requests. Onboarding new employees (setting up laptops, emails, and accounts)Granting access to software licenses (Figma, Jira, AWS, Office 365)Upgrading hardware or requesting new accessories

BY A SERVICE DESK (Diagram Based)

STOP WORK BLOCKERS

PROBLEM: Employee Downtime & System Crashes. Work halts.

SOLUTIONS: Quick fixes, self-service, instant resolution routes.

SUPPORT CHAOS

PROBLEM: Misrouted Requests & lost emails. No accountability.

SOLUTIONS: Single Point of Contact (SPOC) and organized ticketing.

CORE IT OPERATIONAL PROBLEMS BY A SERVICE DESK (Diagram Based)

ACCESS DELAYS

PROBLEM: Onboarding Bottlenecks & Software License Waits. Days of lost productivity.

SOLUTIONS: Automated request fulfillment and access workflows.

SECURITY RISKS

PROBLEM: Unauthorized Access & Ghost Hardware. Data breaches, unmanaged devices.

SOLUTIONS: Identity verification, multi-factor auth, asset management.

UNTRACKED ISSUES

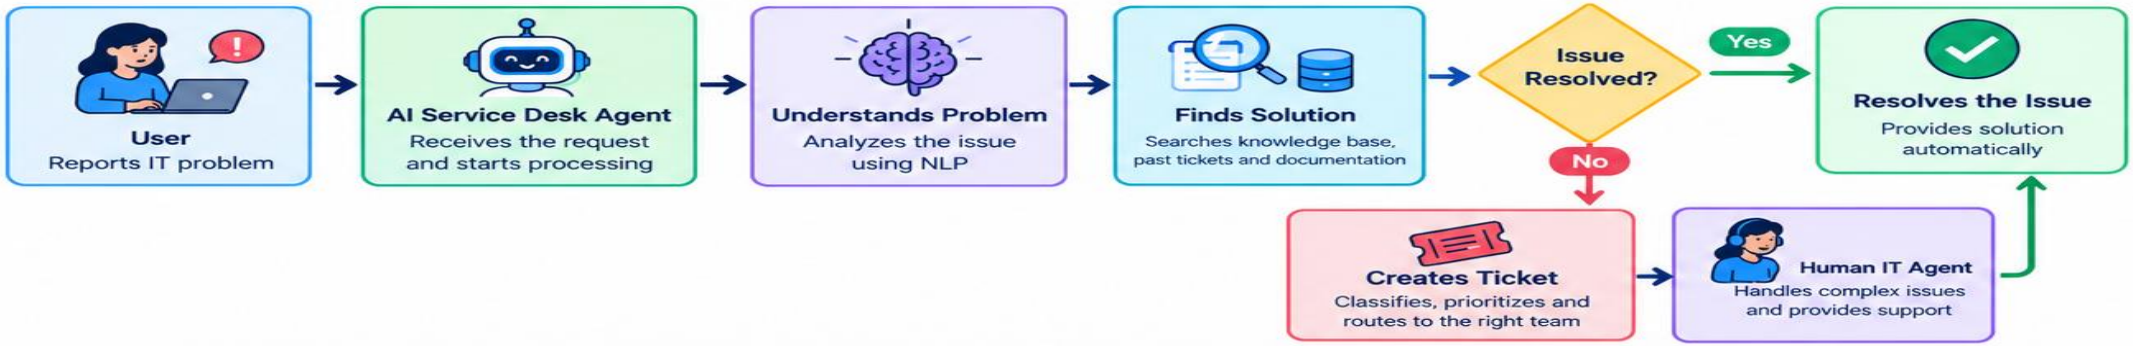

PROBLEM: SLA Breaches & Forgotten Requests. No visibility.

SOLUTIONS: Ticketing system with Service Level Agreement tracking and analytics

Intelligent IT Service Desk Agent

Real-Time Example

Let's see how it works when an employee raises an IT issue.

Real-Time Example

Scenario: An employee cannot access the internet on their laptop.

1 User Reports the Issue

Hi, my laptop is connected to Wi-Fi but I cannot access the internet.

10:05 AM

User types the problem in natural language.

2 AI Agent Understands

I understand that you are facing a network issue. Let me check the possible solutions from our knowledge base.

10:05 AM

Searching knowledge base...

- Checking common fixes
- Matching with past tickets
- Finding relevant solution

10:06 AM

AI analyzes the issue using NLP and searches the knowledge base.

3 AI Finds Solution

Try these steps to fix the issue:
1. Forget the Wi-Fi network and reconnect.
2. Restart your laptop.
3. If it still doesn't work, try resetting the network settings.

10:06 AM

I tried these steps, but it still doesn't work.

10:10 AM

Agent provides step-by-step solution. If not resolved...

4 Creates Ticket & Escalates

I'm creating a ticket for the **Network Support Team** with high priority.

Ticket ID	:	#IT12345
Category	:	Network
Priority	:	High
Assigned To	:	Network Team

10:11 AM

Ticket is created, classified, prioritized and routed to the right team.

5 Human IT Agent Handles

Hi! I see your ticket #IT12345. Our team has fixed the issue. Please try connecting again. Let us know if you need further help.

10:25 AM

Human agent resolves the issue (if needed) and updates the user.

Issue Resolved

It's working now! Thank you so much!

10:28 AM

Glad to hear that! If you face any more issues, just message us anytime.

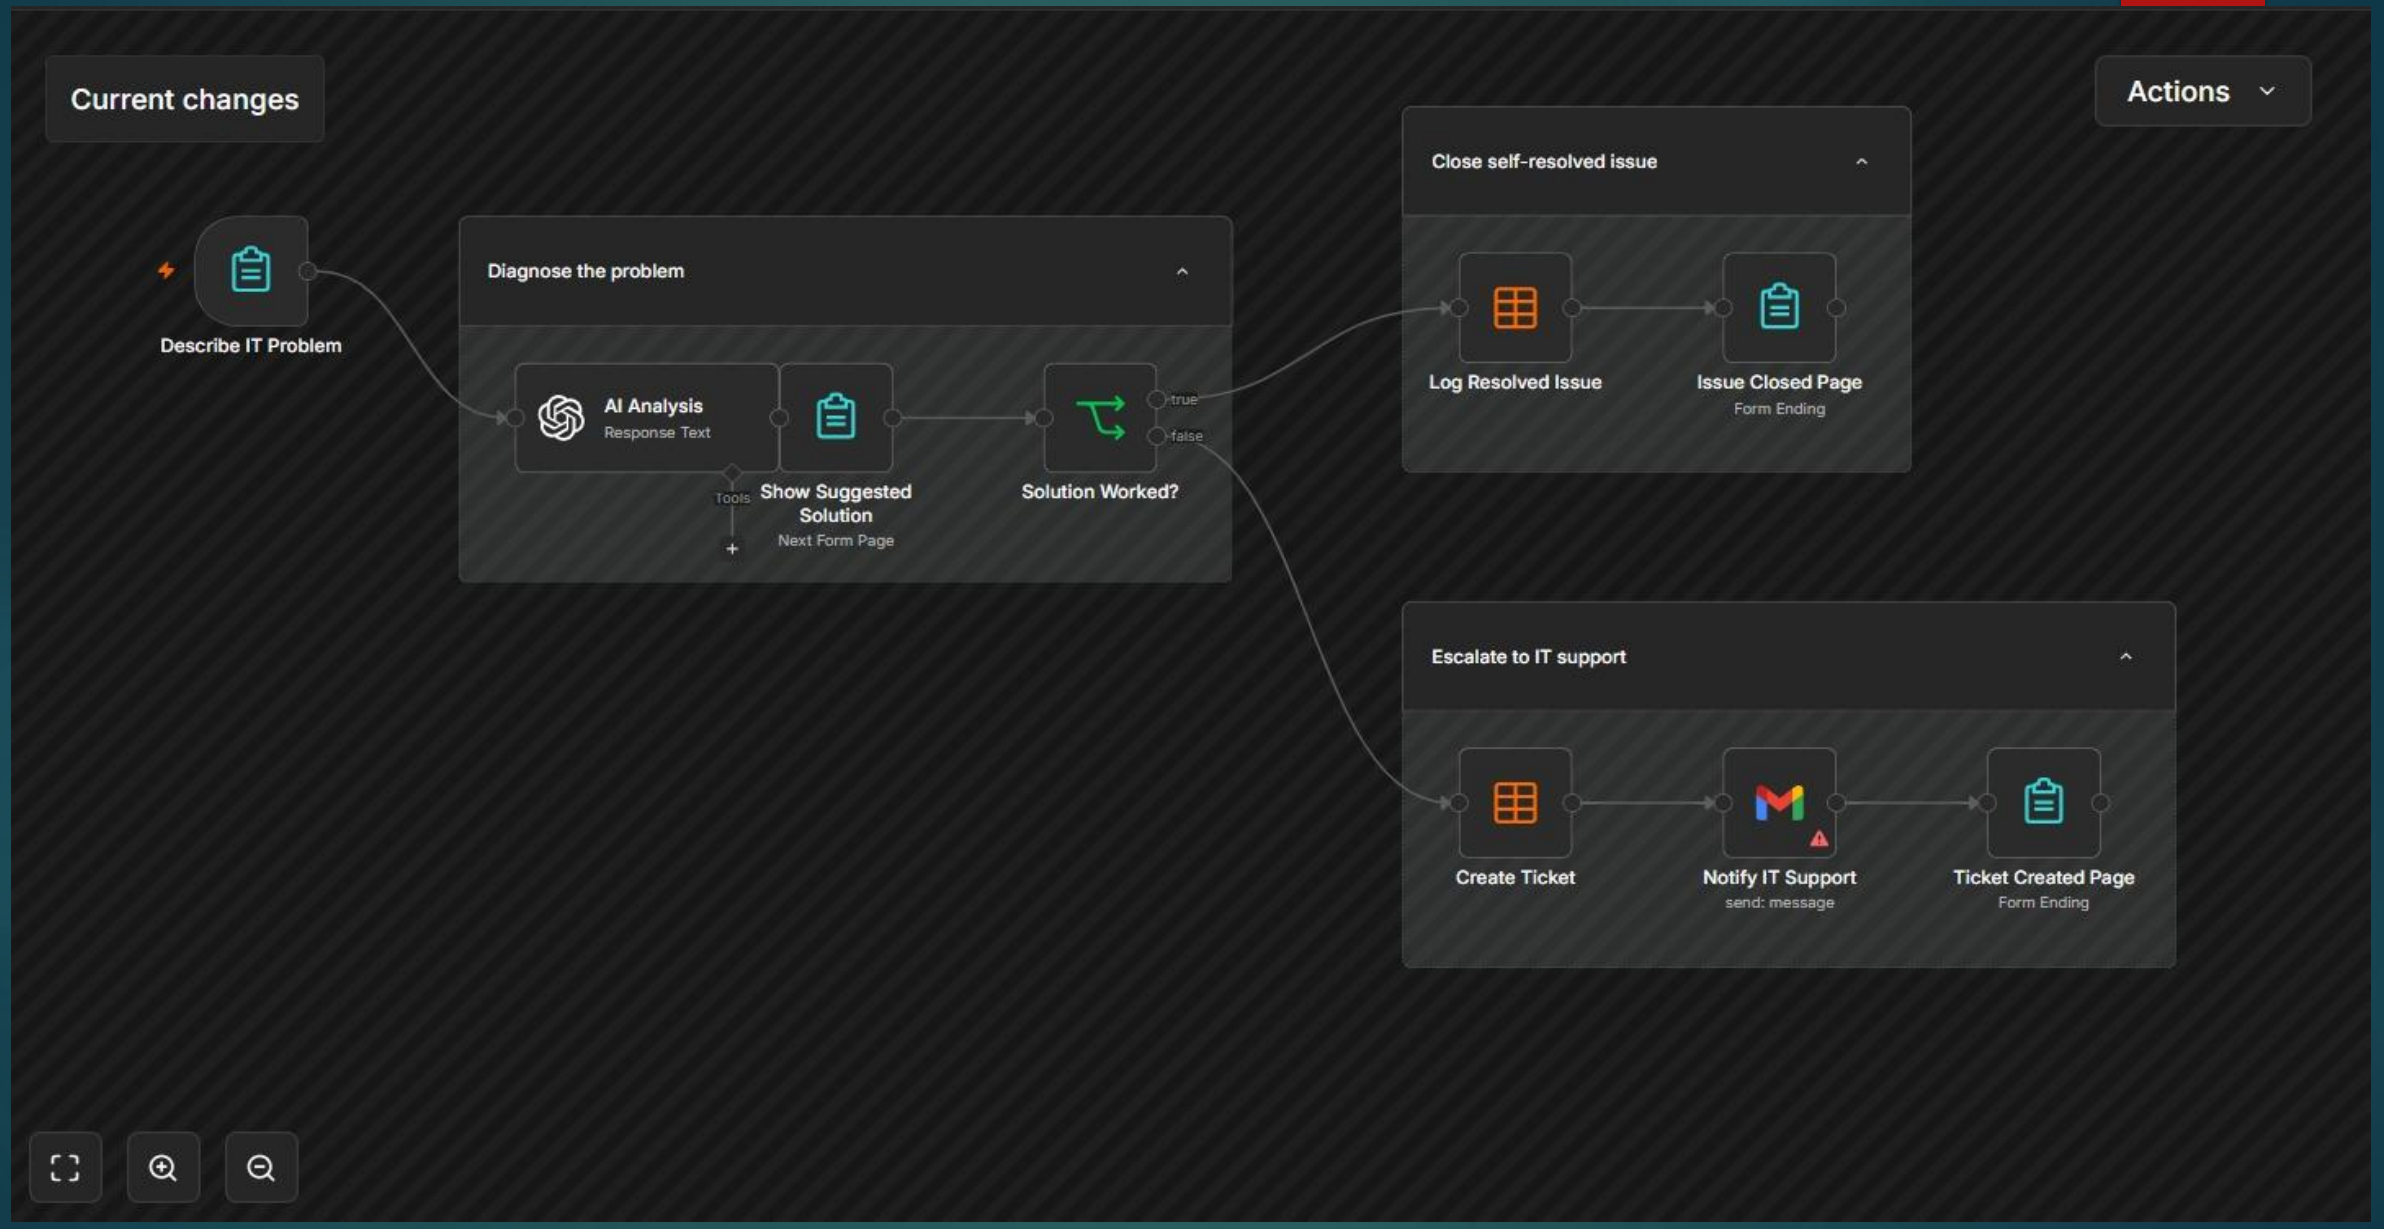

10:28 AM

Ticket Closed

User is happy. Issue resolved successfully!

Step 1 – User reports the problem:
The employee tells the AI agent, "*My laptop is connected to Wi-Fi, but I cannot access the internet.*"
Step 2 – AI understands the problem:
The AI analyzes the user's message using **Natural Language Processing (NLP)** and identifies it as a **network-related issue**.
Step 3 – AI finds a solution:
The AI searches its **knowledge base, previous tickets, and IT documentation** and provides troubleshooting steps such as reconnecting Wi-Fi or restarting the laptop.

Step 4 – Ticket creation:
If the suggested solution does not work, the AI automatically creates a support ticket, assigns a priority, and sends it to the appropriate **Network** Support Team.
Step 5 – Human IT agent:
A human IT agent receives the ticket, investigates the problem, and provides the required support.
Step 6 – Issue resolved:
Once the problem is fixed, the user confirms that the internet is working again, and the ticket is closed.
